3. 3D printing technology is used to create a prototype of a part.

4. The part is then manufactured using a CNC machine.

### 3D printing

3D printing is a process of creating a three-dimensional object from a digital file.

The process involves creating a 3D model of the part, which is then sliced into thin layers.

These layers are printed one by one, building up the part layer by layer.

The most common materials used for 3D printing are plastic and metal.

3D printing is a fast and efficient way to create prototypes.

It is also used for manufacturing small quantities of parts.

3D printing can be used to create parts that are difficult to manufacture using traditional methods.
